WHY WE EXIST

The Rawli thesis

The next generation of users will not want separate apps for events, stocks, research, rewards, funding, and portfolio tracking. Rawli puts the whole journey into one clean wallet experience.

rawli.markets

Testing phase. Availability depends on route, market, wallet network, liquidity, and region.

Prediction markets are no longer a niche corner

The world is starting to trade information. Rawli is being built where that growth meets mobile wallets, crypto-native liquidity, and AI-assisted decisions.

MARKET PULL

The growth signal

Pew Research, using The Block data, reported combined monthly global volume on Kalshi and Polymarket rising from less than \$5B in September 2025 to about \$24B in April 2026. Polymarket International alone was about \$9B in April 2026.

FOCUS

Where the money flows

Sports, politics, and crypto accounted for about 90% of Polymarket volume since July 2024. That is why Rawli keeps its market board focused instead of trying to copy every market on the internet.

OUR LANE

Why Rawli taps the growth in dollars

When prediction volume grows, users need better discovery, clearer odds, faster funding, cleaner portfolio views, and intelligence that explains the market before they trade. Rawli is not trying to be another odds website. Rawli is the terminal around the liquidity.

Sources for market context: Pew Research Center analysis of The Block data, accessed May 2026. Polymarket in this document refers to Polymarket International unless noted. This guide is not an offer, broker recommendation, or guarantee of trading availability.

Stocks are also moving toward wallet rails

The second wave is tokenized equities: users want price exposure to global companies without the old maze of broker apps, forms, settlement delays, and currency friction.

GLOBAL STOCKS

What is already happening

Ondo expanded tokenized U.S. stocks and ETFs to BNB Chain, bringing 100+ assets to one of the most active crypto networks. PancakeSwap and BNB wallet routes are becoming the natural path for wallet users.

SIMPLE ACCESS

What Rawli adds

Rawli turns those routes into a simple product surface: search, filters, quote, route safety, buy, sell, portfolio, and stock analysis. The user should not need to understand router internals to own a fraction of a global asset.

THE STORY

The access story

Imagine an 18 year old in Lagos with a wallet and a small amount of USDT. Instead of waiting on a traditional brokerage account, foreign card, or paperwork-heavy process, they open Rawli, read the asset brief, and buy fractional stock exposure where routes are supported. That is the emotional unlock: global markets start feeling reachable.

Important: tokenized stocks are not the same as direct shareholder ownership. Rawli routes buy and sell swaps where supported. Issuer onboarding, direct redemption, and certain jurisdictions can still require eligibility checks outside Rawli.

Rawli turns scattered tools into one experience

The community problem is not lack of markets. The problem is friction: discovery is messy, funding is confusing, analysis is scattered, and rewards are not obvious.

PROBLEM

Before Rawli

RAWLI ANSWER

Users jump between Polymarket pages, wallets, bridges, exchanges, charts, Twitter, spreadsheets, and referral trackers.

With Rawli

Market feed, funding, AI reports, trading, portfolio, points, referrals, and stock routes live together in one terminal.

Community value

A beginner can learn; an active trader can move faster; a referrer can grow the network; the product gets better from real usage.

EVENTS

For prediction traders

Rawli makes event markets easier to scan, understand, trade, and track. It adds market-aware analysis so a user knows why a YES or NO call may have edge.

STOCKS

For stock buyers

Rawli makes supported stock tokens feel native to a wallet app: quote, buy, sell, track holdings, and understand risk before clicking.

SEASON 1

For the community

Every useful action can become part of a reward history: trading, quests, premium analysis, referrals, and cashback credits. Rawli is not just building screens. It is building an activity graph for future community ownership.

The product stack is already bigger than a landing page

Rawli has moved past the idea phase. The current build combines live market feeds, backend routing, wallet funding, portfolio state, reports, rewards, and stock routes.

LIVE

Prediction markets

Trade YES or NO on real-world events using Polymarket liquidity. Rawli adds discovery, charts, order preview, route checks, and portfolio tracking.

LIVE

Tokenized stocks / RWA

Buy and sell supported stock tokens on BNB Chain through verified routes where available. Rawli checks routes before enabling action.

ACTIVE

AI intelligence reports

Reports combine odds, technical signals, news, trend structure, liquidity, and route status so users are not trading blind.

CORE

Funding and portfolio

Users can fund from BNB wallets, track pUSD balances, monitor positions, review orders, see settlements, and manage stock holdings.

SEASON 1

Points, referrals, and community rewards

Season 1 tracks real activity: trades, daily quests, analysis unlocks, referrals, and cashback credits. Points are credited automatically and are designed to support future community reward conversion.

Not a Polymarket clone. Not a stock app. A terminal.

Rawli is unique because it sits at the intersection of prediction liquidity, tokenized assets, AI analysis, and community rewards.

One wallet surface

Predictions, stocks, funding, reports, portfolio, and rewards in one flow.

Market-aware AI

Analysis answers the actual question, not just a generic chart direction.

Focused markets

Rawli curates categories where analysis and liquidity matter instead of overwhelming users.

Buy and sell discipline

Stock routes stay disabled if Rawli cannot verify an executable exit path.

Community flywheel

Referrals, points, quests, cashback, and future governance rewards turn users into early participants.

POSITIONING

The simple sentence

Rawli helps a user discover what the world is pricing, understand what the market may be missing, and act from their wallet without leaving the product.

From curiosity to ownership in minutes

The product should feel simple enough for a new user and useful enough for an active trader.

1

Connect wallet

Use a supported wallet and stay on the correct BNB network for funding and stock routes.

2

Explore markets

Find prediction events or tokenized stocks using focused categories, search, and filters.

3

Read intelligence

See the verdict, risk notes, odds context, stock route status, and what could invalidate the thesis.

4

Trade if ready

Sign orders or swaps from the wallet. Rawli should explain failures in human language.

5

Track outcome

Portfolio, open orders, settlement state, stock holdings, and funding status stay visible.

6

Earn activity

Points, referrals, quests, cashback credits, and leaderboard status grow from real usage.

Why this matters

A product wins when users come back because it saves them effort. Rawli reduces the distance between question, conviction, action, and reward.

The future is bigger than U.S. tech stocks

Rawli starts where routes are available today, but the bigger opportunity is a global asset terminal where users can move between world events, U.S. stocks, African equities, and other tokenized markets.

NGX EQUITIES

early tokenization rails

FUTURE LANE

African stock potential

Emerging African tokenization projects are already pointing toward tokenized MTN Nigeria, Dangote Cement, GTCO, Zenith Bank, UBA, Airtel Africa, Seplat, and more. Rawli can become the clean interface when compliant routes mature.

GLOBAL LANE

Global expansion

Beyond U.S. equities, the same product design can support ETFs, African equities, commodities, bonds, forex-style assets, and event markets as reliable on-chain liquidity appears.

WHAT WE ARE BUILDING TOWARD

The community upside

Most young users do not care which financial rail is underneath. They care whether they can understand it, access it, exit it, and track it. Rawli can become the front door for that new generation of asset ownership.

African stock examples are future opportunity areas, not current Rawli listings unless separately announced. Any future African equities route should depend on regulated partners, issuer permissions, custody, liquidity, and local securities rules.

Participation should feel visible

Rawli rewards are designed around activity people can understand: trade, learn, refer, complete quests, and build public reputation on the leaderboard.

ACTION

REWARD BEHAVIOR

Verified trade

Auto-credited after matched routed trading activity is recorded

Daily quests

+25 to +50 points depending on the quest

Premium analysis

+150 points when an analysis unlock is recorded

Referral joins

+50 points to the new user when a valid code is used

Active referral

+500 points to the referrer after the referred user trades

AUTOMATIC

No claim friction

Points are added to the user balance automatically. Users should not need to claim routine activity rewards one by one.

FUTURE

Community token path

Points are planned as the history Rawli can use for future governance-token and community reward conversion. Final reward terms should be announced clearly before distribution.

EARLY USERS

Why early activity matters

In a network product, the first users do more than test buttons. They shape categories, stress the flows, invite the next wave, and create the data Rawli uses to improve.

The excitement is real, and the guardrails matter

Rawli should be shared as a powerful testing-phase product, not as a promise of guaranteed profit, guaranteed access, or guaranteed rewards.

WALLET

Self-custody first

Rawli never needs a user seed phrase. Wallets sign actions, and users remain responsible for assets, networks, approvals, and transactions they confirm.

TRUTH

Availability is conditional

A trade may be unavailable because of region, liquidity, route health, balance, allowance, market status, wallet network, or upstream provider status.

RWA

Tokenized stock clarity

Tokenized stock exposure is not the same as direct shareholder ownership. Rawli routes swaps where supported and does not provide issuer redemption inside the app.

RISK

No financial advice

AI reports, odds, charts, and community rewards are decision-support tools. They do not guarantee profit or remove trading risk.

This is why Rawli matters

A normal user should be able to trade what the world is talking about, own a fraction of the companies shaping the future, understand risk before acting, and earn reputation for helping the network grow.

Numbers used in this guide

These public references were used for the market context. They should be refreshed before major fundraising, legal, or press distribution.

TOPIC

REFERENCE NOTE

Prediction market volume

Pew Research Center analysis of The Block data: Kalshi + Polymarket rose from less than \$5B monthly volume in Sep 2025 to about \$24B in Apr 2026; Polymarket International was about \$9B in Apr 2026.

Category concentration

Pew: sports, politics, and crypto made up about 90% of Polymarket trading volume since July 2024.

Ondo on BNB

CoinDesk and Ondo/BNB announcements: Ondo brought 100+ tokenized U.S. stocks and ETFs to BNB Chain / PancakeSwap routes.

Ondo eligibility

Ondo docs: issuer onboarding and direct acquisition/redemption can require eligibility checks in certain jurisdictions.

African equities future

xNG and DotVest public materials describe tokenized African equities, NGX market opportunity, and examples like MTN, Dangote, GTCO, Zenith, UBA, Airtel Africa, and Seplat.
